

Amanorsac Studio — Website, App Store & Client Portal

amanorsac.studio

RELEASED (platform) · apps vary by product

Internal product-analysis brief · prepared for company-wide standards work

Homepage (index.html) — rotating hero, fixed left nav, per-app accent theming.

1 · PRODUCT IDENTITY

Category	Web platform — marketing/portfolio site + software distribution store + client project portal. Not a plugin/instrument/DAW itself.
One-line	The public site, app store, and logged-in client portal for Stephen Amanor Sackey's audio production studio.
Primary purpose	Win mixing/production clients; distribute the studio's 4 in-house audio apps; manage active client work post-booking.
Intended users	Prospective/active mixing clients · app downloaders · booked clients (portal) · studio owner (admin).
Status	Platform: Released , live in production. PulseRoom & Nebula Tide: released/downloadable. HarmonieMD & PerformLive: in development, shown as "Coming soon."

2 · WHAT IT DOES

- Main function:** portfolio + lead gen, app distribution, and client project management in one site.
- Key features:** email-gated downloads (magic link + signed, expiring tickets); moderated app reviews restricted to verified downloaders via a 7-day post-download invite email; live download counters; blog CMS; photo gallery; analytics dashboard; client portal (messages, deliverables, invoices, project stages); admin tools (subscriber CSV export, review moderation, download stats).
 - Typical workflow:** visitor → Apps page → verify email → download → (7 days later) review-invite email → leaves a verified review. Separately: booked client logs into /client → sees stage, messages, deliverables, invoices.
 - Distinctive:** reviews are cryptographically gated to a real, dated download — not open submission; every download/review link is a short-lived signed ticket, never a raw storage URL; unfinished apps are honestly labelled "coming soon" rather than oversold.

3 · VISUAL / UX IDENTITY

TYPE & COLOR
Sora (display/headings), Inter (body), JetBrains Mono (labels/eyebrows). Per-section CSS "room" tokens re-theme each page: brand orange default, copper (Mixing), blush (Live), mint (Apps), gold (Piano); each of the 4 apps then carries its own further accent (PulseRoom cyan, Nebula Tide bright cyan, PerformLive violet, HarmonieMD green).

SURFACES & COMPONENTS
Warm light paper on marketing pages; dark near-black on app/portal pages. Full-pill buttons (filled + ghost). Rounded bordered cards; translucent blurred panels on dark pages. Fixed icon+label left nav, collapsing on mobile. Minimal tabs/dropdowns (mostly single-purpose pages; portal has project-stage tabs).

MOTION & STATES
Shared cubic-bezier ease tokens, plain CSS transitions (no animation library). Hover = border/glow brighten via color-mix(); disabled = dimmed + pointer-blocked. One decorative animated waveform on the homepage hero — not a functional audio meter.

5 · TECHNICAL SNAPSHOT

STACK
Static HTML/CSS/vanilla JS — no framework, no build step. One Cloudflare Worker (worker.js) as router + static-asset fallback + daily cron.

DATA & AUTH
Supabase (Postgres + RLS + Supabase Auth). Browser never writes a table directly — only SECURITY DEFINER RPC functions, no service_role key in any client code.

STORAGE & EMAIL
Cloudflare R2 for installers (one legacy Dropbox fallback still in code). Resend for all transactional email (download confirmations, review invites, client notices).

APPS DISTRIBUTED
PulseRoom, Nebula Tide (Win/Mac, released); HarmonieMD, PerformLive (in dev). Their native/DSP source is **not** in this repository.

UPDATES & LICENSING
One static JSON version-check endpoint (Nebula Tide only) polled by the app; no auto-download. No licensing/activation — apps are free, unmetered downloads.

SECURITY
HMAC-SHA256 signed, time-limited tickets on every download/review link; site-wide CSP.

6 · AMANORSAC STANDARDIZATION

- KEEP**
- Signed-ticket download/review pattern
 - RPC-only DB access (no direct table writes)
 - Per-page CSS "room" token re-theming
 - No-build vanilla JS (auditable per file)
- STANDARDIZE**
- App readiness labeling — only 2 of 4 apps flag status
 - Nebula Tide's JSON update-check → shared format for all apps
 - Shared review/download module → default for future apps, not a special case
- MISSING**
- Unified Amanorsac account (portal auth ≠ download identity today)
 - App licensing/activation, seat management
 - Standardized in-app updater (only 1 app has any version check)
 - Installer signing/notarization docs
 - Crash reporting, telemetry consent UI
 - Site-wide Privacy Policy / Terms pages (none exist yet)
 - Accessibility audit; written design-system spec
